Seeking Healthy Volunteers to Participate in a Study of the Effects of Hallucinogens on the Brain

Researchers at the Johns Hopkins University are seeking healthy individuals who have used hallucinogens in the past to participate in a research study looking at the effects of psilocybin, a psychoactive substance found in naturally occurring mushrooms. The study will investigate psychological and emotional effects of psilocybin. Brain imaging will be conducted to investigate changes in the brain that might relate to psychological and emotional effects of psilocybin.

Volunteers must be healthy, between the ages of 18 and 45, and have no recent history of alcoholism or drug abuse.

To discuss the possibility of volunteering or to learn more:

Phone: 410–550–2253 or
Email: PsilocybinBrainStudy@jhmi.edu

Confidentiality will be maintained for all applicants and participants.
Principal Investigator: Frederick S. Barrett, Ph.D., -- Protocol: NA_IRB00102081
